Avalanche.report

| Danger level             | Characteristics   | Recommendations for backcountry recreationists  |
|--------------------------|---|---|
| <b>5</b><br>very high    | <b>Disaster situation</b><br>Numerous large and very large natural avalanches can be expected. These can reach roads and settlements in the valley.   | You are advised not to engage in winter sports beyond open ski runs and trails.   |
| <b>4</b><br>high         | <b>Very critical avalanche situation</b><br>Natural and often large avalanches are likely. Avalanches can easily be triggered on many steep slopes. Remote triggering is typical. Whumpf sounds and shooting cracks occur frequently.   | Stay on moderately steep terrain. Heed runout zones of large avalanches. Unexperienced persons should remain on open ski runs and trails.<br>Around 10 % of avalanche fatalities.   |
| <b>3</b><br>considerable | <b>Critical avalanche situation</b><br>Whumpf sounds and shooting cracks are typical. Avalanches can easily be triggered, particularly on steep slopes with the aspect and elevation indicated in the avalanche bulletin. Natural avalanches and remote triggering can occur. | The most critical situation for backcountry recreationists. Select best possible route and take action to reduce risks. Avoid very steep slopes with the aspect and elevation indicated in the avalanche bulletin. Unexperienced persons are advised to remain on open ski runs and trails.<br>Around 50 % of avalanche fatalities. |
| <b>2</b><br>moderate     | <b>Mostly favourable avalanche situation</b><br>Warning signs can occur in isolated cases. Avalanches can be triggered in particular on very steep slopes with the aspect and elevation indicated in the avalanche bulletin. Large natural avalanches are unlikely.           | Routes should be selected carefully, especially on slopes with the aspect and elevation indicated in the avalanche bulletin. Travel very steep slopes one person at a time. Pay attention to unfavourable snowpack structure (persistent weak layers, old snow problem).<br>Around 30 % of avalanche fatalities.                    |
| <b>1</b><br>low          | <b>Generally favourable avalanche situation</b><br>No warning signs present. Avalanches can only be triggered in isolated cases, in particular on extremely steep slopes.   | Travel extremely steep slopes one person at a time and be alert to the danger of falling.<br>Around 5 % of avalanche fatalities.  |

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →

on Friday 07 12 2018

Wind-drifted  
snow

From a snow sport perspective, in most cases insufficient snow is lying in all altitude zones. The avalanche conditions are generally favourable.

Currently there are favourable conditions generally. The avalanche prone locations are to be found in particular adjacent to ridgelines in northwest to north to east facing aspects above approximately 2000 m. Wind slabs can in isolated cases be released by large loads. Elsewhere, avalanches can scarcely be released.

## Snowpack

### Danger patterns

dp 6: cold, loose snow and wind

In the last few days rather small wind slabs formed in particular adjacent to ridgelines. These have bonded quite well with the old snowpack.

## Tendency

Hardly any increase in avalanche danger.

## No Rating

From a snow sport perspective, in most cases insufficient snow is lying.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 07 12 2018

Wind-drifted  
snow

From a snow sport perspective, in most cases insufficient snow is lying in all altitude zones. The avalanche conditions are generally favourable.

Currently there are favourable conditions generally. The avalanche prone locations are to be found in particular adjacent to ridgelines in northwest to north to northeast facing aspects above approximately 2500 m. Wind slabs can still in isolated cases be released by large loads. Elsewhere, avalanches can scarcely be released.

## Snowpack

### Danger patterns

dp 6: cold, loose snow and wind

Over a wide area 10 cm of snow, and up to 20 cm in some localities, fell above approximately 2000 m. In the last few days rather small wind slabs formed in particular adjacent to ridgelines. These have bonded quite well with the old snowpack.

## Tendency

Hardly any increase in avalanche danger.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Friday 07 12 2018

Wind-drifted  
snow

### Wind slabs are to be evaluated with care and prudence.

The sometimes avalanche-prone wind slabs are lying on soft layers. The avalanche prone locations are to be found in particular in northwest to north to southeast facing aspects above approximately 2500 m and at transitions from a shallow to a deep snowpack. Winter sport participants can release avalanches in isolated cases, including medium-sized ones. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

### Snowpack

**Danger patterns**

dp 6: cold, loose snow and wind

In particular in the northwest up to 10 cm of snow. fell above approximately 1600 m. The fresh snow and wind slabs are lying on top of a quite favourable old snowpack.
