Avalanche.report

## Danger Level 3 - Considerable

**Tendency: Increasing avalanche danger**  
on Sunday 09 12 2018

Wind-drifted  
snow

Gradual increase in avalanche danger as a consequence of fresh snow and stormy weather.

By the evening the wind slabs will increase in size substantially. As a consequence of fresh snow and stormy weather natural avalanches are possible as the day progresses, but they can reach medium size. In addition the sometimes fresh snow-covered wind slabs in particular adjacent to ridgelines in all aspects and generally at high altitudes are easily triggered. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and careful route selection.

## Snowpack

In particular along the border with Tirol stormy weather and fresh snow to intermediate altitudes. The backcountry touring conditions are to some extent unfavourable.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Sunday 09 12 2018

Wind-drifted  
snow

The wind slabs are easy for the trained eye to recognise and to be assessed with care and prudence.

The old snowpack remains in most cases well bonded. In some cases various wind slab layers are lying on the smooth surface of an old snowpack.

### Snowpack

**Danger patterns**

dp 1: deep persistent weak layer

Fresh and older wind slabs represent the main danger. Below approximately 2500 m small and, in isolated cases, medium-sized moist loose snow avalanches are possible.

### Tendency

The snowpack remains in most cases favourable.
