Avalanche.report

Danger Level 3 - Considerable

Tendency: Increasing avalanche danger on Monday 10 12 2018

Wind-drifted snow

Treeline

Gradual increase in avalanche danger as a consequence of fresh snow and stormy weather.

By the evening the wind slabs will increase in size substantially. As a consequence of fresh snow and stormy weather natural avalanches are possible as the day progresses, but they can reach medium size. In addition the sometimes fresh snow-covered wind slabs in particular adjacent to ridgelines in all aspects and generally at high altitudes are easily triggered. The prevalence of avalanche prone locations and likelihood of triggering will increase at high altitude and in the high Alpine regions. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and careful route selection.

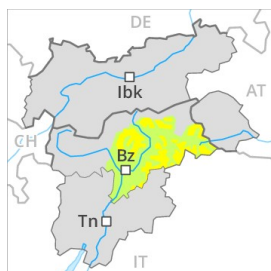

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

In particular along the border with Tirol stormy weather and fresh snow to intermediate altitudes. The backcountry touring conditions are to some extent unfavourable.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger
on Monday 10 12 2018 →

Wind-drifted
snow

Fresh wind slabs require caution.

In the last few days mostly small wind slabs formed in particular adjacent to ridgelines as well as at high altitude. These avalanche prone locations are to be found especially in places that are protected from the wind above approximately 2200 m. Winter sport participants can release avalanches in some places, including medium-sized ones. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Snowpack

The old snowpack will be generally well bonded. Wind slabs are lying on soft layers. Below approximately 2200 m only a little snow is lying.
