

## Danger Level 2 - Moderate

**Tendency: Increasing avalanche danger**  
on Thursday 13 12 2018

Wind-drifted  
snow

In some localities increase in avalanche danger as a consequence of the sometimes strong northwesterly wind.

The sometimes avalanche-prone wind slabs of the last four days represent the main danger. They are to be found in particular adjacent to ridgelines in all aspects and in the high Alpine regions. Wind slabs can be released, even by small loads in isolated cases and reach medium size. The avalanche prone locations are to be found in particular on steep slopes above approximately 2200 m, and adjacent to ridgelines and in gullies and bowls in all aspects. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and careful route selection.

### Snowpack

Especially in the regions of the north that are exposed to the foehn wind a little fresh snow. The wind has transported the fresh snow and, in some cases, old snow as well. As a consequence of the wind the wind slabs have increased in size additionally. The snowpack will become prone to triggering in particular on wind-loaded slopes.

## Danger Level 1 - Low

Wind-drifted  
snow

Treeline

### A little snow is lying.

The wind slabs represent the main danger. They are mostly shallow and to be assessed with care and prudence.

### Snowpack

Above the tree line a little snow is lying. In some cases wind slabs are lying on the smooth surface of an old snowpack. The old snowpack remains in most cases well bonded.

### Tendency

The snowpack remains in most cases favourable.
