Avalanche.report

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →

on Friday 04 01 2019

Wind-drifted
snow

Persistent
weak layer

The wind slabs represent the main danger.

As a consequence of northerly wind, mostly small wind slabs formed in particular adjacent to ridgelines and in gullies and bowls as well as above approximately 2300 m. They are in many cases rather small but can only be released by large loads in most cases. At high altitudes and in high Alpine regions avalanche prone locations are more prevalent and the danger is greater. These avalanche prone locations are clearly recognisable to the trained eye. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack

The snowpack will be subject to considerable local variations. The mostly small wind slabs must be evaluated with care and prudence in all aspects. Isolated avalanche prone weak layers exist in the snowpack in particular on shady slopes. In steep terrain there is a danger of falling on the hard crust. Below approximately 2500 m a little snow is lying.

Tendency

The avalanche danger will persist.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Friday 04 01 2019

Wind-drifted
snow

Hardly any snow is lying. Wind slabs require caution. Gullies and bowls are especially unfavourable.

The wind slabs represent the main danger. They are to be found in particular adjacent to ridgelines and in gullies and bowls as well as in the high Alpine regions. The avalanche prone locations are rather rare and are easy to recognise. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

Snowpack

From a snow sport perspective, in most cases insufficient snow is lying below approximately 2300 m.

Tendency

The avalanche danger will persist.
