Avalanche.report

Danger Level 4 - High

Tendency: Decreasing avalanche danger
on Monday 07 01 2019

Wind-drifted
snow

The avalanche conditions remain critical.

Remotely triggered and natural avalanches are possible. In all aspects and from starting zones at higher altitudes only isolated medium-sized to large dry slab avalanches are possible as a consequence of fresh snow and stormy weather. Mostly avalanches are shallow and can be released easily by a single winter sport participant. The avalanche prone locations are widespread and are barely recognisable because of the poor visibility. Ski touring and other off-piste activities, including snowshoe hiking, call for great caution and restraint. Exposed transportation routes can be endangered very occasionally. As the day progresses the natural avalanche activity will not yet decrease.

Snowpack

The sometimes deep wind slabs of the last few days are lying on the unfavourable surface of an old snowpack in all aspects. In particular in the Southern Zillertal Alps and High Tauern, in the Val Müstair Alps and in the Langtaufers they have increased in size substantially. For those venturing off piste a very precarious avalanche situation will prevail.

Tendency

The wind will be moderate. Gradual decrease in avalanche danger as a consequence of the ceasing of precipitation.

Danger Level 3 - Considerable

Tendency: Constant avalanche danger →
on Monday 07 01 2019

Wind-drifted
snow

Extensive experience in the assessment of avalanche danger is required.

As a consequence of fresh snow and stormy weather the wind slabs will increase in size additionally as the day progresses. These can in many cases be released by small loads or triggered naturally. Especially on wind-loaded slopes medium-sized natural avalanches must be expected in isolated cases. The avalanche prone locations are to be found on steep slopes in all altitude zones. They are barely recognisable because of the poor visibility. The conditions are very dangerous for backcountry touring and other off-piste activities.

Snowpack

Especially along the border with Austria in some localities 10 cm of snow will fall. The storm force wind will transport the fresh snow significantly. Fresh snow and wind slabs are lying on soft layers. Isolated avalanche prone weak layers exist in the old snowpack. The snowpack will be weakly bonded over a wide area. Medium-sized and, in isolated cases, large dry slab avalanches are possible in particular adjacent to ridgelines and in gullies and bowls.

Tendency

The wind will be moderate. The fresh wind slabs are bonding only slowly with the old snowpack in particular on steep shady slopes.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →

on Monday 07 01 2019

Wind-drifted
snow

Wind slabs require caution.

In all aspects the wind slabs have increased in size moderately in the last few days. These can in some places be released by small loads. The avalanche prone locations are to be found in gullies and bowls above approximately 2000 m, and adjacent to ridgelines in all aspects. Mostly the avalanches are only small but in many cases easily released.

Snowpack

The wind slabs have bonded insufficiently with the old snowpack. The near-surface layers of the snowpack necessitate caution. The snowpack will be subject to considerable local variations. In steep terrain there is a danger of falling on the hard snow surface.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Monday 07 01 2019

Wind-drifted
snow

Only a little snow is lying.

The fresh and older wind slabs represent the main danger. They are to be found especially adjacent to ridgelines and in gullies and bowls and generally at high altitudes. These avalanche prone locations are rather rare and are easy to recognise. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack

The snowpack will be subject to considerable local variations above approximately 2300 m. Below approximately 2300 m from a snow sport perspective, in most cases insufficient snow is lying. The surface of the snowpack has frozen to form a strong crust. There is a danger of falling on the icy crust.

Tendency

Stormy weather.
