Avalanche.report

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Thursday 14 03 2019

Wind-drifted
snow

Treeline

Wind slabs in particular adjacent to ridgelines and in gullies and bowls.

Hardly any more natural avalanches are to be expected. In particular shady slopes where weaknesses exist in the old snowpack are especially precarious. In addition the mostly small wind slabs of last week in particular adjacent to ridgelines and at elevated altitudes are prone to triggering in some cases still. These can be released, in particular by large loads.

Snowpack

Outgoing longwave radiation during the night will be quite good. The surface of the snowpack will freeze to form a strong crust and will soften during the day. The more recent wind slabs have formed in all aspects. The fresh snow and wind slabs of last week have bonded quite well with the old snowpack in particular on sunny slopes. Faceted weak layers exist deeper in the old snowpack especially in shady places that are protected from the wind.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Thursday 14 03 2019

Favourable situation

Treeline

In all altitude zones only a little snow is lying. At elevated altitudes a mostly favourable avalanche situation will prevail.

The mostly small wind slabs of last week can be released, especially by large additional loads. The avalanche prone locations are to be found in high Alpine regions and adjacent to ridgelines and in gullies and bowls above approximately 2000 m.

Snowpack

The old snowpack will be subject to considerable local variations. Only a little snow is lying on north and northeast facing slopes. Adjacent to ridgelines and in gullies and bowls mostly small wind slabs formed. On south facing slopes no snow is lying in all altitude zones.
