

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Thursday 09 01 2020

Wind-drifted  
snow

Treeline

A mostly favourable avalanche situation will be encountered over a wide area. Wind slabs require caution.

The fresh and somewhat older wind slabs are to be evaluated with care and prudence above the tree line. The avalanche prone locations are to be found in particular on northwest to north to northeast facing wind-loaded slopes. Mostly avalanches are only small but can be released in isolated cases by a single winter sport participant. The wind slabs are clearly recognisable to the trained eye.

A latent danger of gliding avalanches exists.

Dry avalanches can in very isolated cases be released in the old snowpack, mostly by large additional loads, in particular on very steep shady slopes. Transitions from a shallow to a deep snowpack are unfavourable.

### Snowpack

#### Danger patterns

dp 6: cold, loose snow and wind

The sometimes storm force wind has transported some snow. In some places wind slabs are lying on old snow containing large grains, in particular on shady slopes.

Faceted weak layers exist deeper in the old snowpack in particular in areas where the snow cover is rather shallow, especially on very steep shady slopes.

### Tendency

Gradual increase in danger of gliding avalanches as a consequence of warming.
