

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Tuesday 28 01 2020

Wind-drifted  
snow

The backcountry touring conditions are generally favourable. Wind slabs require caution.

The somewhat older wind slabs are to be avoided in particular in extreme terrain. Mostly avalanches are only small and can be released by large loads. At high altitudes and in high Alpine regions avalanche prone locations are a little more prevalent. Adjacent to ridgelines avalanches can be triggered in deep layers of the snowpack and reach medium size in some cases. Apart from the danger of being buried, restraint should be exercised in view of the danger of avalanches sweeping people along and giving rise to falls. In steep terrain there is a danger of falling on the hard snow surface.

## Snowpack

### Danger patterns

dp 6: cold, loose snow and wind

The snowpack remains generally stable. In particular shady slopes where hard layers are lying on a weakly bonded old snowpack are unfavourable. Such avalanche prone locations are rather rare and are barely recognisable, even to the trained eye.

## Tendency

As a consequence of fresh snow and wind there will be an increase in the avalanche danger.
