

Danger Level 3 - Considerable

Tendency: Constant avalanche danger →
 on Sunday 16 02 2020

Wind-drifted
 snow

Wet snow

Fresh wind slabs require caution.

The fresh wind slabs can be released by a single winter sport participant in all aspects above approximately 2200 m. These avalanche prone locations are quite prevalent but are easy to recognise. They are to be avoided as far as possible. The avalanches are medium-sized.

Gradual increase in danger of dry and moist avalanches as a consequence of warming during the day and solar radiation.

Weakly bonded old snow is to be evaluated critically. Avalanche prone locations are to be found in particular on very steep west, north and east facing slopes between approximately 2200 and 2800 m. Caution is to be exercised in particular at transitions from a shallow to a deep snowpack in little used backcountry terrain.

There is a danger of falling on the hard snow surface.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

dp 7: snow-poor zones in snow-rich surrounding

The more recent wind slabs are lying on unfavourable layers. They remain in some cases prone to triggering. Faceted weak layers exist in the old snowpack, in particular between approximately 2200 and 2800 m. The snowpack will be subject to considerable local variations.

Tendency

Temporary increase in danger of moist and wet avalanches as a consequence of warming during the day and solar radiation.

Danger Level 3 - Considerable

Tendency: Constant avalanche danger →
 on Sunday 16 02 2020

Fresh wind slabs require caution.

The fresh wind slabs can be released by a single winter sport participant in all aspects above approximately 2000 m. These avalanche prone locations are quite prevalent but are easy to recognise. They are to be avoided as far as possible. In these regions the avalanches can be released in deep layers of the snowpack and reach quite a large size.

Gradual increase in danger of dry and moist avalanches as a consequence of warming during the day and solar radiation.

Weakly bonded old snow is to be evaluated critically. Avalanche prone locations are to be found in particular on very steep west, north and east facing slopes between approximately 2200 and 2800 m. Caution is to be exercised in particular at transitions from a shallow to a deep snowpack in little used backcountry terrain.

There is a danger of falling on the hard snow surface.

Danger Level 3 - Considerable

Tendency: Decreasing avalanche danger
 on Sunday 16 02 2020

Wind-drifted
 snow

Persistent
 weak layer

Wind slabs and weakly bonded old snow at high altitude.

The fresh wind slabs can be released by a single winter sport participant in some cases in particular on very steep shady slopes above approximately 2200 m. Caution is to be exercised adjacent to ridgelines. These avalanche prone locations are clearly recognisable to the trained eye. The avalanches are rather small. Weakly bonded old snow requires caution. Avalanche prone locations are to be found in particular on very steep west, north and east facing slopes between approximately 2400 and 3000 m. Caution is to be exercised in particular at transitions from a shallow to a deep snowpack in little used backcountry terrain. Avalanches can be released, in particular by large loads and reach large size in isolated cases. In addition a certain danger of gliding avalanches exists. This applies on steep grassy slopes below approximately 2400 m. Below the tree line a low avalanche danger will be encountered over a wide area.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

dp 7: snow-poor zones in snow-rich surrounding

Faceted weak layers exist in the old snowpack, in particular between approximately 2400 and 3000 m. The sometimes storm force wind has transported some snow. The fresh wind slabs are in some cases prone to triggering in particular on very steep shady slopes above approximately 2200 m. The wind slabs of the last few days have bonded quite well with the old snowpack. The snowpack will be subject to considerable local variations.

Tendency

Gradual decrease in avalanche danger.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Sunday 16 02 2020

Wind-drifted
snow

Treeline

Fresh wind slabs represent the main danger.

Fresh wind slabs are to be evaluated with care and prudence. The avalanche prone locations are to be found in particular on very steep slopes above approximately 2200 m, especially in gullies and bowls, and behind abrupt changes in the terrain. These places are clearly recognisable to the trained eye. Mostly the avalanches are small.

Individual avalanche prone locations for dry avalanches are to be found also on extremely steep shady slopes at high altitudes and in high Alpine regions. This applies in areas where the snow cover is rather shallow. Avalanches can be released, mostly by large loads in isolated cases and reach medium size. In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

The strong wind has transported some snow. The fresh wind slabs are in some cases prone to triggering above approximately 2200 m. These are mostly small. In very isolated cases relatively hard layers of snow are lying on old snow containing large grains. This applies especially on shady slopes at high altitudes and in high Alpine regions. The snowpack will be subject to considerable local variations.

Tendency

The avalanche danger will persist.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
 on Sunday 16 02 2020

Wind-drifted
 snow

Treeline

Wet snow

Caution is to be exercised on wind-loaded slopes. As a consequence of warming and solar radiation an unfavourable avalanche situation will be encountered in some regions.

Fresh wind slabs represent the main danger. As a consequence of a moderate to strong northwesterly wind, sometimes easily released wind slabs formed in all aspects. As the day progresses in particular on wind-loaded slopes there will be a gradual increase in the danger of gliding avalanches and moist snow slides. The more recent wind slabs are clearly recognisable, in particular adjacent to ridgelines and in gullies and bowls at high altitudes and in high Alpine regions. In particular in gullies and bowls the wind slabs have increased in size additionally.

Weakly bonded old snow: Individual avalanche prone locations for dry avalanches are to be found in particular on steep north facing slopes above approximately 2300 m. Caution is to be exercised in particular at transitions from a shallow to a deep snowpack in little used backcountry terrain. Avalanches can be released by large loads and reach medium size. Gradual increase in danger of dry and moist avalanches as a consequence of warming.

In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

The fresh wind slabs remain in some cases prone to triggering in all aspects above the tree line.

Faceted weak layers exist in the old snowpack in particular on west, north and east facing slopes. This applies in particular above approximately 2300 m, especially in little used backcountry terrain.

Tendency

The avalanche danger will persist. Fresh wind slabs are to be evaluated with care and prudence.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
 on Sunday 16 02 2020

Wind-drifted
 snow

Wet snow

Dry slab avalanches and moist snow slides during the day are possible.

Fresh wind slabs require caution. The avalanche prone locations are to be found especially on very steep northeast, north and southeast facing slopes above approximately 2200 m, especially in gullies and bowls, and behind abrupt changes in the terrain. These places are clearly recognisable to the trained eye. Mostly the avalanches are small.

In steep terrain there is a danger of falling on the hard snow surface.

As a consequence of warming during the day and solar radiation moist and wet avalanches are possible. This applies in particular in case of releases originating from very steep, sunny starting zones below approximately 2600 m that have retained the snow thus far.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

The somewhat older wind slabs are mostly small. In very isolated cases relatively hard layers of snow are lying on old snow containing large grains. This applies especially on shady slopes at high altitudes and in high Alpine regions. The snowpack will be subject to considerable local variations.

Tendency

The avalanche danger will persist. The weather will be very mild.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
 on Sunday 16 02 2020

Wind-drifted
 snow

Persistent
 weak layer

Fresh wind slabs represent the main danger.

As a consequence of fresh snow and a strong to storm force wind, mostly small wind slabs formed, caution is to be exercised in particular on shady slopes as well as adjacent to ridgelines and in gullies and bowls in particular above approximately 2000 m.

Weakly bonded old snow requires caution. This applies in particular on very steep shady slopes on wind-loaded slopes. The avalanches are rather small and can be released by large loads.

In addition a low (level 1) danger of gliding avalanches exists.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

dp 4: cold following warm / warm following cold

The sometimes strong wind has transported some snow.

Faceted weak layers exist in the old snowpack in particular on shady slopes. The snowpack will be subject to considerable local variations.

Tendency

Gradual decrease in avalanche danger.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
 on Sunday 16 02 2020

Fresh wind slabs require caution. As a consequence of warming and solar radiation an unfavourable avalanche situation will be encountered in some regions.

Fresh wind slabs require caution. There is a danger of falling on the icy crust. The avalanche prone locations are to be found in particular on very steep shady slopes above approximately 1800 m, and adjacent to ridgelines and in gullies and bowls in all aspects. These places are clearly recognisable to the trained eye. Mostly the dry avalanches are medium-sized and can be released in some cases by a single winter sport participant. Isolated avalanche prone weak layers exist in the snowpack especially on steep shady slopes. Gradual increase in avalanche danger as a consequence of warming.

Snowpack

The more recent wind slabs are in some cases prone to triggering above the tree line. These are mostly small. The older wind slabs have bonded well with the old snowpack. The snowpack will be subject to considerable local variations.

Tendency

The avalanche danger will persist. Fresh wind slabs require caution.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Sunday 16 02 2020

Wind-drifted
snow

Treeline

Wet snow

Fresh wind slabs require caution.

The fresh snow and wind slabs must be evaluated with care and prudence in all aspects above the tree line. In steep terrain there is a danger of falling on the hard snow surface. The avalanche prone locations are to be found in particular on very steep shady slopes above approximately 1800 m and adjacent to ridgelines. These places are rare and are clearly recognisable to the trained eye. As a consequence of warming and solar radiation a moderate danger of moist avalanches will be encountered in some regions. Mostly the avalanches are small.

Snowpack

The fresh wind slabs are poorly bonded with the old snowpack in particular on very steep shady slopes above the tree line.

Tendency

The avalanche danger will persist. Fresh wind slabs require caution.
