1800m

Tendency: Constant avalanche danger →
 on Tuesday 25 02 2020

Wet snow

2600m
 1800m

Wind-drifted
 snow

2400m

The backcountry touring conditions in the morning are mostly favourable.

The rather small wind slabs have bonded quite well with the old snowpack. These can only be released by large loads in most cases. The avalanche prone locations are to be found in particular on steep northwest to north to southeast facing slopes above approximately 2400 m, especially in gullies and bowls, and behind abrupt changes in the terrain. These places are clearly recognisable to the trained eye. In steep terrain there is a danger of falling on the icy crust. The early morning will see quite favourable conditions generally, but the danger of wet and gliding avalanches will increase later. This applies in particular on steep grassy slopes and at the base of rock walls below approximately 2600 m.

Snowpack

The fresh and somewhat older wind slabs are mostly small and can only be released in isolated cases. In some cases relatively hard layers of snow are lying on old snow containing large grains. Faceted weak layers exist deep in the snowpack in particular on shady slopes. The snowpack will be subject to considerable local variations. The surface of the snowpack will freeze to form a strong crust only at high altitudes and will soften during the day. Below approximately 2000 m only a little snow is lying on south and southwest facing slopes.

Tendency

Temporary increase in danger as the day progresses.

Danger Level 1 - Low

AM:

Tendency: Constant avalanche danger →
 on Tuesday 25 02 2020

Favourable situation

PM:

Tendency: Constant avalanche danger →
 on Tuesday 25 02 2020

Wet snow

The snowpack will be generally well bonded.

The rather small wind slabs have bonded quite well with the old snowpack. These can only be released by large loads in most cases. The avalanche prone locations are to be found in particular on steep northwest to north to southeast facing slopes, especially in gullies and bowls, and behind abrupt changes in the terrain. In steep terrain there is a danger of falling here.

The early morning will see quite favourable conditions generally, but the avalanche danger will increase later. In particular on steep grassy slopes individual small and, in isolated cases, medium-sized natural moist avalanches are possible.

Danger patterns

dp 10: springtime scenario

The fresh and somewhat older wind slabs are mostly small and can only be released in isolated cases. In some cases relatively hard layers of snow are lying on old snow containing large grains. Faceted weak layers exist deep in the snowpack in particular on shady slopes. The snowpack will be subject to considerable local variations. The surface of the snowpack will only just freeze and will soften during the day. On south and southwest facing slopes a little snow is lying in all altitude zones.

Tendency

The conditions are mostly favourable.
