

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Friday 06 03 2020

Wind-drifted
snow

Wet snow

Wind slabs at high altitude. Wet and gliding snow require caution.

As a consequence of a moderate to strong wind from southerly directions, mostly small wind slabs will form. The somewhat older wind slabs of the last few days remain in some cases prone to triggering in particular on very steep shady slopes above approximately 2200 m. The fresh and somewhat older wind slabs can be released by a single winter sport participant in some cases. The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls in northwest to north to northeast facing aspects. At elevated altitudes the avalanche prone locations are more prevalent. In the regions neighbouring those that are subject to danger level 3 (considerable) and in the regions exposed to heavier precipitation the avalanche danger is higher.

In addition there is a danger of gliding avalanches and moist snow slides. This applies in particular on steep sunny slopes and on steep grassy slopes.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

dp 3: rain

The wind slabs of the last few days have settled a little. Some snow will fall from the afternoon in particular along the border with Vorarlberg and along the border with South Tyrol, also in the Schober Mountains and in the Glockner Range. The southerly wind will transport the fresh and old snow. Low and intermediate altitudes: Some rain will fall in some localities. The snowpack will be subject to considerable local variations.

Outgoing longwave radiation during the night will be severely restricted over a wide area.

Tendency

Slight increase in avalanche danger as a consequence of the precipitation.
