

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Monday 09 03 2020

Wind-drifted
snow

Fresh wind slabs at high altitude. On extremely steep slopes a large number of loose snow avalanches are to be expected.

As a consequence of fresh snow and a sometimes strong wind from northwesterly directions, wind slabs formed. These can be released by a single winter sport participant in isolated cases at high altitudes and in high Alpine regions. The avalanche prone locations are to be found in particular on very steep shady slopes and adjacent to ridgelines above approximately 2400 m. These places are sometimes covered with fresh snow but are clearly recognisable to the trained eye. The avalanches are rather small. In high Alpine regions the avalanche prone locations are more prevalent and larger. As a consequence of warming during the day and the solar radiation, the likelihood of slab avalanches being released will increase a little. As a consequence of warming during the day and solar radiation more frequent small and, in isolated cases, medium-sized loose snow avalanches are to be expected. On sunny slopes the avalanche prone locations are more prevalent.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

dp 9: graupel blanketed with snow

10 to 20 cm of snow, and even more in some localities, fell. The northwesterly wind has transported the fresh snow. In some places fresh snow and wind slabs are lying on soft layers, especially on shady slopes at high altitudes and in high Alpine regions. The older wind slabs have bonded well with the old snowpack. The old snowpack will be generally stable. The snowpack will become moist as the day progresses. This applies in particular on steep sunny slopes.

Tendency

The snow sport conditions outside marked and open pistes are generally favourable.

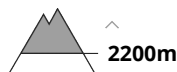

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Monday 09 03 2020

Wind-drifted
snow

Fresh wind slabs at high altitude. On extremely steep slopes a large number of mostly small loose snow avalanches are to be expected.

As a consequence of a sometimes strong wind from northwesterly directions, mostly small wind slabs formed. These can be released by a single winter sport participant in isolated cases at high altitudes and in high Alpine regions. The avalanche prone locations are to be found in particular on very steep shady slopes and adjacent to ridgelines. Such avalanche prone locations are clearly recognisable to the trained eye. In some cases the avalanches are medium-sized.

As a consequence of warming during the day and solar radiation more frequent mostly small moist loose snow avalanches are to be expected. This applies in particular on extremely steep sunny slopes. In highly frequented off-piste terrain and on popular backcountry touring routes the situation is more favourable.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

dp 9: graupel blanketed with snow

The northwesterly wind has transported the fresh snow. In some places fresh snow and wind slabs are lying on soft layers, especially on shady slopes at high altitudes and in high Alpine regions. In very isolated cases weak layers exist in the old snowpack on shady slopes. The snowpack will become moist as the day progresses. This applies in particular on steep sunny slopes. At low and intermediate altitudes only a little snow is lying.

Tendency

The snow sport conditions outside marked and open pistes are generally favourable.
