

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Tuesday 22 12 2020

Persistent weak layer

Weak layers in the lower part of the snowpack necessitate defensive route selection.

Weak layers in the lower part of the snowpack can be released in some places by individual winter sport participants. Caution is to be exercised in particular on steep shady slopes above approximately 2200 m, as well as on steep sunny slopes above approximately 3000 m, especially in areas where the snow cover is rather shallow, as well as at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. Avalanches can be triggered in the faceted old snow and reach a dangerous size. These avalanche prone locations are difficult to recognise. In the regions with a lot of snow the situation is more favourable.

As a consequence of a sometimes strong southwesterly wind, mostly small wind slabs will form in some places. Fresh and somewhat older wind slabs are rather small but in some cases prone to triggering, in particular on very steep shady slopes.

The current avalanche situation calls for meticulous route selection.

Snowpack

Danger patterns

dp.1: deep persistent weak layer

dp.7: snow-poor zones in snow-rich surrounding

Steep shady slopes: The old snowpack will be prone to triggering in some places. Towards its base, the snowpack is faceted and weak. Whumpfung sounds and the formation of shooting cracks when stepping on the snowpack are a clear indication of a weakly bonded snowpack. Towards its surface, the snowpack is largely stable. The sometimes strong wind will transport only a little snow.

Very steep sunny slopes as well as low and intermediate altitudes: The snowpack is largely stable and its surface has a melt-freeze crust that is strong in many cases.

East and west facing slopes: The snowpack is largely stable and its surface has a melt-freeze crust that is not capable of bearing a load. Faceted weak layers exist deep in the snowpack above approximately 3000 m.

Tendency

The avalanche danger will persist.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Tuesday 22 12 2020

Gliding snow

Caution is to be exercised in areas with glide cracks.

On very steep grassy slopes and on sunny slopes more gliding avalanches are possible, even quite large ones. Areas with glide cracks are to be avoided.

Fresh and somewhat older wind slabs can be released in isolated cases on very steep shady slopes in high Alpine regions. This applies in particular adjacent to ridgelines.

Snowpack

Danger patterns

dp.2: gliding snow

The snowpack is largely stable and its surface has a melt-freeze crust that is strong in many cases, in particular on very steep sunny slopes, as well as at low and intermediate altitudes.

Towards its base, the snowpack is faceted. This applies on steep shady slopes above the tree line, as well as on sunny slopes in high Alpine regions.

As a consequence of a moderate wind from westerly directions, mostly small wind slabs will form in particular adjacent to ridgelines.

Tendency

The avalanche danger will persist.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Tuesday 22 12 2020

The avalanche conditions are mostly favourable.

Fresh and somewhat older wind slabs can be released in isolated cases on very steep shady slopes in high Alpine regions. This applies especially adjacent to ridgelines. They are mostly only small.

On very steep grassy slopes and on sunny slopes only isolated gliding avalanches are possible. Areas with glide cracks are to be avoided.

Snowpack

The snowpack is largely stable and its surface has a melt-freeze crust that is strong in many cases, in particular on very steep sunny slopes, as well as at low and intermediate altitudes. East and west facing slopes: The surface of the snowpack is frozen, but not to a significant depth.

Towards its base, the snowpack is faceted. This applies on shady slopes above the tree line, as well as on sunny slopes in high Alpine regions.

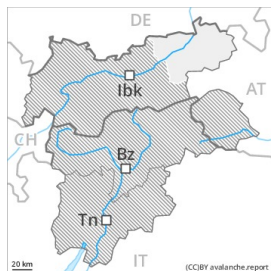

As a consequence of a sometimes strong southwesterly wind, mostly small wind slabs will form in particular adjacent to ridgelines.

Tendency

The avalanche conditions are mostly favourable.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Tuesday 22 12 2020

Low, level 1.

Low, level 1. At low and intermediate altitudes from a snow sport perspective, in most cases insufficient snow is lying.

Snowpack

At low and intermediate altitudes hardly any snow is lying. At higher altitudes a little snow is lying. The snowpack is largely stable.

Tendency

A generally favourable avalanche situation will prevail.
