

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Monday 08 03 2021

A clear night will be followed by favourable conditions generally.

Dry avalanches can be released in deeper layers in very isolated cases. This applies on extremely steep shady slopes above approximately 2200 m at transitions from a shallow to a deep snowpack.

Ortler Range, along the border with Tirol: As a consequence of new snow and a moderate to strong northwesterly wind, wind slabs formed in particular adjacent to ridgelines. They are mostly rather small but in some cases prone to triggering.

Slight increase in danger of moist and wet avalanches as a consequence of warming during the day and solar radiation, in particular on steep sunny slopes and below approximately 2400 m.

### Snowpack

The snowpack will be stable over a wide area. The surface of the snowpack has frozen to form a strong crust and will hardly soften at all. In steep terrain there is a danger of falling on the hard snow surface. Isolated avalanche prone weak layers exist in the old snowpack. This applies on shady slopes above approximately 2200 m.

### Tendency

Currently there are favourable conditions.
