

## Danger Level 2 - Moderate

**Tendency: Increasing avalanche danger**  
on Sunday 14 03 2021

Wind-drifted  
snow

### Fresh wind slabs require caution.

The more recent wind slabs are mostly rather small but can be released easily. Caution is to be exercised in particular on steep shady slopes above approximately 2200 m, as well as adjacent to ridgelines and in gullies and bowls. At high altitudes and in high Alpine regions the avalanche prone locations are more prevalent. These avalanche prone locations are clearly recognisable to the trained eye. In steep terrain there is a danger of falling on the hard snow surface.

### Snowpack

#### Danger patterns

dp.6: cold, loose snow and wind

dp.5: snowfall after a long period of cold

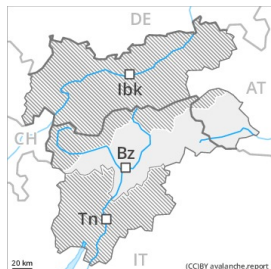

Over a wide area 5 to 10 cm of snow, and even more in some localities, has fallen since Thursday. As a consequence of a strong wind from variable directions, avalanche prone wind slabs formed in some cases. On Saturday the wind slabs will increase in size additionally, especially in the regions exposed to the foehn wind. The wind slabs are lying on soft layers in particular on northwest to north to east facing aspects. The old snowpack will be stable over a wide area. The snowpack is moist, especially on sunny slopes below approximately 2400 m.

### Tendency

Slight increase in avalanche danger as a consequence of new snow and wind.

## Danger Level 1 - Low

**Tendency: Increasing avalanche danger**  
on Sunday 14 03 2021

Wind-drifted  
snow

2200m
