

Danger Level 1 - Low

Tendency: Increasing avalanche danger
on Sunday 14 03 2021

Wind-drifted
snow

2200m

Currently there are favourable conditions mostly.

The backcountry touring conditions are mostly favourable. Individual avalanche prone locations are to be found especially in extremely steep terrain at high altitude and on very steep sunny slopes, in isolated cases also on very steep grassy slopes in particular at intermediate altitudes. As a consequence of a moderate wind, mostly small wind slabs formed in some localities, especially adjacent to ridgelines and in gullies and bowls at high altitude. They are mostly very small but can be released in isolated cases. In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

The snowpack will be generally stable. The surface of the snowpack will freeze to form a strong crust and will soften during the day. Isolated avalanche prone weak layers exist in the old snowpack, in particular on steep slopes in high Alpine regions, and on shady slopes. On sunny slopes at low and intermediate altitudes hardly any snow is lying.

Tendency

In some localities increase in danger as a consequence of the moderate to strong wind.
