Avalanche.report **Monday 07.03.2022** Updated 06 03 2022, 17:00

Danger Level 1 - Low

Tendency: Constant avalanche danger \longrightarrow on Tuesday 08 03 2022

The backcountry touring conditions are generally favourable.

Avalanches can in very isolated cases be released in the weakly bonded old snow, in particular by large additional loads. This applies on very steep shady slopes above approximately 2400 m, especially in little used terrain at transitions from a shallow to a deep snowpack. Avalanches can reach medium size.

In addition the wind slabs at elevated altitudes are prone to triggering in very isolated cases still. The wind slabs are clearly recognisable to the trained eye.

Snowpack

Danger patterns

(dp.7: snow-poor zones in snow-rich surrounding)

ig(dp.6: cold, loose snow and wind ig)

In very isolated cases weak layers exist in the centre of the snowpack, especially on very steep shady slopes above approximately 2400 m, but in isolated cases also in areas where the snow cover is rather shallow at high altitudes and in high Alpine regions.

The wind slabs have bonded well with the old snowpack.

Only a small amount of snow is lying for the time of year.

Tendency

Low avalanche danger will prevail.
