## 

Tendency: Constant avalanche danger on Tuesday 29032022

## 2600m

Wet snow

## The avalanche conditions are spring-like. The avalanche danger will increase during the day.

Late morning: A clear night will be followed by favourable conditions generally. There is a danger of falling on the hard snow surface. Afternoon: As a consequence of warming during the day and solar radiation there will be an increase in the avalanche danger. Wet avalanches can be released by a single winter sport participant and reach medium size, especially on very steep east, south and west facing slopes below approximately 2600 m . In addition individual gliding avalanches and snow slides are possible. Backcountry tours should be concluded timely.

## Snowpack

## Danger patterns

dp.10: springtime scenario
Outgoing longwave radiation during the night will be good over a wide area. The surface of the snowpack will freeze to form a strong crust and will soften during the day. Sunshine and high temperatures will give rise as the day progresses to softening of the snowpack on very steep sunny slopes.
Less snow than usual is lying.

## Tendency

Outgoing longwave radiation during the night will be reduced. This applies in particular in the west.

## Danger Level 1 - Low

## Tendency: Constant avalanche danger

on Tuesday 29032022

## Over a wide area from a snow sport perspective, insufficient snow is lying. Wet snow requires caution.

A clear night will be followed in the early morning by favourable conditions over a wide area. The danger of moist and wet snow slides will increase a little during the day.

## Snowpack

## Danger patterns <br> dp.10: springtime scenario

Only a little snow is now lying.
Outgoing longwave radiation during the night will be good over a wide area. The surface of the snowpack will freeze to form a strong crust. Sunshine and high temperatures will give rise as the day progresses to softening of the snowpack in particular on steep sunny slopes.

## Tendency

The conditions remain spring-like.
