Danger Level 2 - Moderate

AM:

Tendency: Constant avalanche danger →
on Wednesday 13 04 2022

PM:

Tendency: Constant avalanche danger →
on Wednesday 13 04 2022

As the day progresses a moderate danger of wet avalanches will prevail.

The early morning will see quite favourable conditions mostly. Individual avalanche prone locations for dry avalanches are to be found in particular on very steep shady slopes above approximately 2800 m and adjacent to ridgelines in all aspects. Older wind slabs in very steep terrain are to be bypassed as far as possible.

As a consequence of warming during the day and solar radiation there will be an increase in the danger of wet avalanches. Small and, in isolated cases, medium-sized wet avalanches are possible. This applies in particular on west, south and east facing slopes below approximately 2800 m, as well as on shady slopes below approximately 2200 m.

Snowpack

Danger patterns

dp.10: springtime scenario

dp.6: cold, loose snow and wind

The wind slabs have bonded quite well with the old snowpack. They are in individual cases still prone to triggering at elevated altitudes.

On Tuesday it will be very mild. The surface of the snowpack has frozen to form a strong crust and will already soften in the late morning. The spring-like weather conditions as the day progresses will give rise to significant softening of the snowpack. This applies on steep sunny slopes below approximately 2600 m, as well as on shady slopes below approximately 2200 m.

Less snow than usual is lying.

Tendency

The conditions are spring-like. Increase in danger of wet avalanches as a consequence of warming during

the day and solar radiation.

Danger Level 1 - Low

AM:

Tendency: Constant avalanche danger →
on Wednesday 13 04 2022

PM:

Tendency: Constant avalanche danger →
on Wednesday 13 04 2022

The conditions are spring-like.

Only a little snow is now lying. The early morning will see favourable conditions generally. As a consequence of warming during the day and solar radiation moist snow slides are possible.

Snowpack

Danger patterns dp.10: springtime scenario

In all aspects as well as in all altitude zones only a little snow is now lying.

The surface of the snowpack has frozen to form a strong crust and will soften earlier than the day before.

The small wind slabs of the weekend have bonded well with the old snowpack.

Tendency

The conditions are spring-like. Slight increase in danger of moist snow slides as a consequence of warming during the day and solar radiation.
