Danger Level 2 - Moderate

AM:

Tendency: Constant avalanche danger →
on Friday 22 04 2022

PM:

Tendency: Constant avalanche danger →
on Friday 22 04 2022

As a consequence of warming and solar radiation a moderate danger of wet avalanches will prevail.

The early morning will see favourable conditions over a wide area. In the afternoon as a consequence of warming during the day and solar radiation there will be a gradual increase in the danger of wet avalanches, in particular on very steep sunny slopes below approximately 2800 m, as well as on shady slopes below approximately 2400 m. Backcountry tours should be started early and concluded timely.

Snowpack

Danger patterns

dp.10: springtime scenario

During the night the weather will be partly cloudy, especially on the Main Alpine Ridge and to the south. The spring-like weather conditions as the day progresses will give rise to gradual softening of the snowpack. This applies in particular on steep sunny slopes, as well as in all aspects below approximately 2400 m.

Towards its base, the snowpack is well consolidated. In all regions only a small amount of snow is lying for the time of year. At low and intermediate altitudes from a snow sport perspective, in most cases insufficient snow is lying.

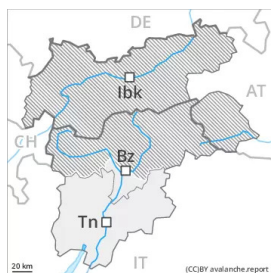

Tendency

In the north a generally clear night: The avalanche conditions are spring-like.

In the south an overcast night: The surface of the snowpack will freeze, but a strong crust will not form and will already be soft in the early morning.

Danger Level 1 - Low

Tendency: Increasing avalanche danger
on Friday 22 04 2022

Wet and gliding avalanches require caution.

The backcountry touring conditions remain spring-like. The early morning will see favourable conditions mostly. As a consequence of warming there will be only a slight increase in the danger of wet avalanches, in particular on very steep sunny slopes below approximately 2400 m. Individual mostly small natural avalanches are possible. Backcountry tours should be concluded timely. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

Snowpack

Danger patterns

dp.10: springtime scenario

On Thursday it will be very cloudy. The surface of the snowpack will only just freeze and will soften quickly. This applies in particular on steep slopes below approximately 2400 m. Towards its base, the snowpack is well consolidated. At low and intermediate altitudes from a snow sport perspective, insufficient snow is lying. From the afternoon the wind will be moderate to strong adjacent to ridgelines.

Tendency

On Friday it will be very cloudy. Some snow will fall until the afternoon in particular in the west and in the east. Until the afternoon the wind will be moderate to strong adjacent to ridgelines. The avalanche danger will increase a little during the day.
