Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Saturday 23 04 2022

From late morning a moderate danger of wet avalanches will prevail.

The danger of gliding avalanches and wet snow slides will already be elevated in the early morning. This applies especially on very steep slopes below approximately 2400 m. As a consequence of the moist air individual small and medium-sized natural avalanches are possible. As the day progresses the likelihood of avalanches being released will increase a little.

Snowpack

Danger patterns

dp.10: springtime scenario

The surface of the snowpack will cool hardly at all during the overcast night and will already be soft in the early morning. Some rain will fall. This applies below approximately 2000 m. The weather conditions as the day progresses will give rise to gradual softening of the snowpack. This applies in particular below approximately 2400 m. At elevated altitudes the avalanche situation is generally favourable.

In all regions only a small amount of snow is lying for the time of year. At low and intermediate altitudes from a snow sport perspective, in most cases insufficient snow is lying.

Tendency

Saturday: During the night the weather will be very cloudy. The weather will be mild. The avalanche danger will already be elevated in the early morning. The prevalence of avalanche prone locations and likelihood of triggering will increase as the day progresses.

Danger Level 2 - Moderate

AM:

Tendency: Constant avalanche danger →
on Saturday 23 04 2022

PM:

Tendency: Constant avalanche danger →
on Saturday 23 04 2022

As a consequence of warming and solar radiation a moderate danger of wet avalanches will prevail.

The early morning will see favourable conditions over a wide area. In the afternoon as a consequence of warming during the day and solar radiation there will be a gradual increase in the danger of wet avalanches, in particular below approximately 2600 m below approximately 2400 m. Backcountry tours should be started early and concluded timely.

Snowpack

Danger patterns

dp.10: springtime scenario

During the night the weather will be clear over a wide area. The spring-like weather conditions as the day progresses will give rise to gradual softening of the snowpack. This applies in particular below approximately 2600 m. Until the evening the weather will be cloudy over a wide area.

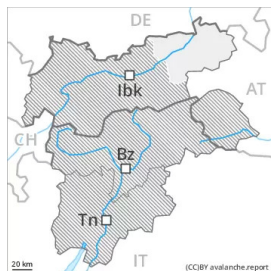

Towards its base, the snowpack is well consolidated. In all regions only a small amount of snow is lying for the time of year. At low and intermediate altitudes from a snow sport perspective, in most cases insufficient snow is lying.

Tendency

Saturday: During the night the weather will be cloudy. The weather will be mild. The avalanche danger will already be elevated in the early morning. The prevalence of avalanche prone locations and likelihood of triggering will increase as the day progresses.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Saturday 23 04 2022

Low avalanche danger will be encountered over a wide area.

The early morning will see favourable conditions over a wide area. In the afternoon as a consequence of warming during the day and solar radiation there will be only a slight increase in the danger of wet avalanches.

Snowpack

Danger patterns

dp.10: springtime scenario

A generally clear night. The spring-like weather conditions as the day progresses will give rise to gradual softening of the snowpack. This applies in particular below approximately 2600 m.

Towards its base, the snowpack is well consolidated. In all regions only a small amount of snow is lying for the time of year. At low and intermediate altitudes from a snow sport perspective, in most cases insufficient snow is lying.

Tendency

Low avalanche danger will be encountered over a wide area.
