

Danger Level 3 - Considerable

Tendency: Constant avalanche danger →
 on Wednesday 08 02 2023

Persistent weak layer

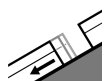

Snowpack stability: **very poor**
 Frequency: **some**
 Avalanche size: **large**

Wind slab

Snowpack stability: **poor**
 Frequency: **some**
 Avalanche size: **medium**

Gliding snow

Snowpack stability: **very poor**
 Frequency: **few**
 Avalanche size: **medium**

The avalanche conditions remain unfavourable. Caution and restraint are advisable.

The avalanche danger is within the upper range of danger level 3 (considerable). Weak layers in the old snowpack can be released very easily in all aspects. The avalanche prone locations are to be found in all aspects above the tree line, also in areas close to the tree line. The avalanche prone locations are quite prevalent and are barely recognisable, even to the trained eye. In some cases the avalanches are large. At transitions from a shallow to a deep snowpack, when entering gullies and bowls for example the likelihood of avalanches being released is greater. Remotely triggered avalanches are possible in isolated cases.

Below approximately 2200 m medium-sized gliding avalanches are possible, in particular in the regions with a lot of snow.

Snowpack

Danger patterns

dp.1: deep persistent weak layer

dp.6: cold, loose snow and wind

The snowpack will be prone to triggering. Distinct weak layers exist in the old snowpack in all aspects, especially on steep shady slopes above the tree line, and in areas close to the tree line, this also applies on steep sunny slopes above approximately 2300 m.

Stability tests and field observations confirm the unfavourable bonding of the snowpack.

Tendency

Wednesday: The snowpack remains prone to triggering. Backcountry touring and other off-piste activities call for caution and restraint.

Danger Level 3 - Considerable

Tendency: Constant avalanche danger →
 on Wednesday 08 02 2023

Persistent weak layer

Snowpack stability: **very poor**
 Frequency: **some**
 Avalanche size: **medium**

Wind slab

Snowpack stability: **poor**
 Frequency: **some**
 Avalanche size: **medium**

The avalanche conditions remain to some extent unfavourable. Caution and restraint are advisable.

Weak layers in the old snowpack can be released very easily in all aspects. The avalanche prone locations are to be found in all aspects above the tree line, but in isolated cases also in areas close to the tree line. The avalanche prone locations are quite prevalent and are barely recognisable, even to the trained eye. Mostly the avalanches are medium-sized. At transitions from a shallow to a deep snowpack, when entering gullies and bowls for example the likelihood of avalanches being released is greater. Remotely triggered avalanches are possible in isolated cases.

Snowpack

Danger patterns

dp.1: deep persistent weak layer

dp.6: cold, loose snow and wind

The snowpack will be prone to triggering. Distinct weak layers exist in the old snowpack in all aspects, especially on steep shady slopes above the tree line, and in areas close to the tree line, this also applies on steep sunny slopes above approximately 2300 m.

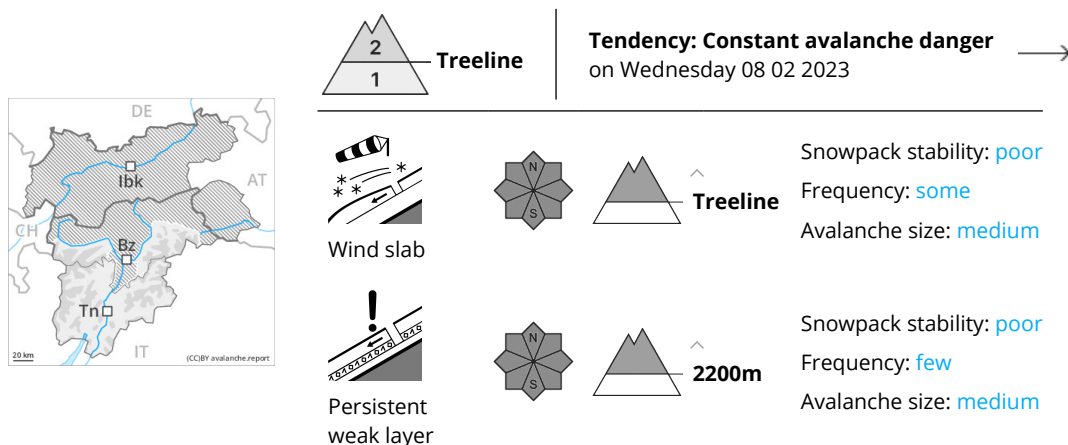

Stability tests and field observations confirm the unfavourable bonding of the snowpack.

Tendency

Wednesday: The snowpack remains prone to triggering. Backcountry touring and other off-piste activities call for caution and restraint.

Danger Level 2 - Moderate

Wind slabs are in some cases prone to triggering.

The no longer entirely fresh wind slabs can be released by a single winter sport participant in some cases in all aspects above the tree line. Individual avalanche prone locations are to be found also in areas close to the tree line. Caution is to be exercised in gullies and bowls, and behind abrupt changes in the terrain, especially on steep shady slopes. The avalanche prone locations are sometimes covered with new snow and are therefore barely recognisable. Mostly avalanches are medium-sized.

In isolated cases avalanches can also be released in the old snowpack. Such avalanche prone locations are to be found on steep, little used shady slopes above approximately 2200 m and on steep sunny slopes above approximately 2500 m.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

Some snow has fallen in some regions. As a consequence of new snow and a strong to storm force wind, wind slabs formed in the last few days over a wide area. They are lying on unfavourable layers in particular on wind-protected shady slopes.

Faceted weak layers exist in the snowpack, especially on shady slopes above approximately 2200 m, as well as on sunny slopes above approximately 2500 m.

Especially at low and intermediate altitudes only a small amount of snow is lying for the time of year. Above the tree line snow depths vary greatly, depending on the influence of the wind.

Tendency

The wintry weather conditions will give rise to slight consolidation of the snowpack. Wind slabs are to be evaluated with care and prudence.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Wednesday 08 02 2023

Individual avalanche prone locations are to be found on very steep slopes at elevated altitudes.

The no longer entirely fresh wind slabs can be released by a single winter sport participant in isolated cases in particular on very steep shady slopes above the tree line. Caution is to be exercised adjacent to ridgelines, as well as in gullies and bowls, and behind abrupt changes in the terrain. The avalanche prone locations are rather rare and are easy to recognise. Wind slabs are to be avoided especially in terrain where there is a danger of falling.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

The snowpack will be generally well bonded. Hardly any weak layers exist in the old snowpack. The fresh and older wind slabs have settled a little. Snow depths vary greatly, depending on the influence of the wind. Only a small amount of snow is lying for the time of year.

Tendency

Low avalanche danger will prevail.
