

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 03 03 2023

### Wind slabs require caution.

A favourable avalanche situation will be encountered over a wide area. The somewhat older wind slabs are unlikely to be released now. Individual avalanche prone locations are to be found on very steep shady slopes at elevated altitudes.

### Snowpack

#### Danger patterns

dp.6: cold, loose snow and wind

The snowpack will be stable over a wide area. The wind slabs have bonded generally well with each other and the old snowpack. They remain in some cases prone to triggering on very steep shady slopes at elevated altitudes.

### Tendency

The avalanche conditions remain favourable. The weather conditions will bring about a strengthening of the snow drift accumulations.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 03 03 2023

Currently there are favourable conditions generally. Fresh wind slabs require caution.

Winter sport participants can release avalanches in isolated cases. The fresh wind slabs are mostly small but can be released in isolated cases. They are to be evaluated with care and prudence in particular on very steep shady slopes at elevated altitudes.

Avalanches can additionally in very isolated cases be released in the weakly bonded old snow also. These avalanche prone locations are to be found in particular on very steep shady slopes and at transitions from a shallow to a deep snowpack. They are very rare but are difficult to recognise.

In many places there is a danger of falling on the hard snow surface.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

In some regions up to 10 cm of snow will fall. The southeasterly wind will transport the new snow. In particular at elevated altitudes mostly small wind slabs will form.

In very isolated cases weak layers exist in the centre of the snowpack, in particular on steep shady slopes at elevated altitudes.

## Tendency

The avalanche conditions remain mostly favourable.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 03 03 2023

Wind slab

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

### Wind slabs require caution.

The wind slabs are to be evaluated with care and prudence in particular on very steep shady slopes above approximately 2600 m. Winter sport participants can release avalanches in isolated cases.

Avalanches can additionally in very isolated cases be released in the weakly bonded old snow also. These avalanche prone locations are to be found in particular on very steep shady slopes and at transitions from a shallow to a deep snowpack, especially at elevated altitudes in the central and eastern parts of the main Alpine ridge.

### Snowpack

#### Danger patterns

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

As a consequence of new snow and a moderate to strong wind from variable directions, wind slabs formed in the last few days in all aspects. In some cases the various wind slabs have bonded still only poorly with each other and the old snowpack, in particular on shady slopes at elevated altitudes.

Faceted weak layers exist in the centre of the snowpack in particular on very steep shady slopes, in particular at elevated altitudes in the central and eastern parts of the main Alpine ridge.

### Tendency

The weather conditions will foster a substantial stabilisation of the snow drift accumulations.
