

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Wednesday 08 03 2023

Low avalanche danger will prevail. Currently there are favourable conditions generally.

Winter sport participants can release avalanches now only rarely.

Fresh and somewhat older wind slabs are to be evaluated with care and prudence in extreme terrain, especially on very steep shady slopes.

Avalanches can additionally in very isolated cases be released in the weakly bonded old snow at high altitude. These avalanche prone locations are to be found in particular on very steep shady slopes and at transitions from a shallow to a deep snowpack. They are very rare but are difficult to recognise.

In many places there is a danger of falling on the hard snow surface.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

Some snow will fall on Tuesday in some localities. The small quantity of fresh snow and the mostly small wind slabs that are forming during the snowfall will be deposited on the favourable surface of an old snowpack on sunny slopes.

In very isolated cases weak layers exist in the centre of the snowpack, in particular on steep shady slopes at high altitude.

The weather conditions as the day progresses will give rise to slight moistening of the snowpack in some cases, in particular at intermediate altitudes.

Tendency

The conditions remain favourable. Low avalanche danger will prevail.
