

Danger Level 3 - Considerable

Tendency: Increasing avalanche danger

on Monday 24 04 2023

Wet snow

2700m

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **large**

Persistent weak layer

2400m

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **large**

Weakly bonded old snow and wet snow represent the main danger. Natural avalanches must be expected more frequently.

Natural moist avalanches are to be expected, this applies already in the early morning. The avalanche prone locations are to be found in all aspects below approximately 2700 m. In isolated cases avalanches can also release deeper layers of the snowpack and reach large size, especially on very steep west, north and east facing slopes above approximately 2400 m.

More small and, in isolated cases, medium-sized loose snow avalanches are possible.

The danger of natural wet avalanches will increase during the day.

Weakly bonded old snow is to be evaluated critically, in particular on steep shady slopes at high altitudes and in high Alpine regions. Avalanches can in some cases be released easily and reach large size.

Snowpack

Danger patterns

dp.10: springtime scenario

dp.4: cold following warm / warm following cold

As a consequence of sharply rising temperatures and high relative humidity an unfavourable avalanche situation will develop by the early morning. The meteorological conditions will prevent a stabilisation of the snowpack during the night.

Avalanche prone weak layers exist in the top section of the snowpack in particular on steep shady slopes. Some snow will fall in some localities.

Tendency

Slight increase in avalanche danger as a consequence of new snow and wind. Afternoon: As a consequence of solar radiation more frequent loose snow avalanches are to be expected, especially on extremely steep sunny slopes.

Danger Level 3 - Considerable

Tendency: Increasing avalanche danger

As a consequence of sharply rising temperatures and high relative humidity an unfavourable avalanche situation will develop by the early morning. The meteorological conditions will prevent a stabilisation of the snowpack during the night.

Avalanche prone weak layers exist in the top section of the snowpack in particular on steep shady slopes. Some snow will fall in some localities.

Tendency

Slight increase in avalanche danger as a consequence of new snow and wind. Afternoon: As a consequence of solar radiation more frequent loose snow avalanches are to be expected, especially on extremely steep sunny slopes.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Monday 24 04 2023

Wet snow requires caution.

Only isolated wet snow slides and avalanches are possible, this applies already in the early morning. The avalanche prone locations are to be found in all aspects.

The danger of wet avalanches will increase during the day.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

As a consequence of mild temperatures and high relative humidity the snowpack can not consolidate during the night. At low and intermediate altitudes hardly any snow is lying.

Tendency

From a snow sport perspective, in most cases insufficient snow is lying.
