

## Danger Level 2 - Moderate

**Tendency: Increasing avalanche danger**  
 on Monday 01 05 2023

Persistent weak layer

Snowpack stability: **poor**  
 Frequency: **few**  
 Avalanche size: **medium**

Wet snow

Snowpack stability: **poor**  
 Frequency: **few**  
 Avalanche size: **medium**

Weakly bonded old snow and wet snow require caution.

More recent wind slabs are to be assessed with care and prudence. The avalanche prone locations are sometimes covered with new snow and are difficult to recognise. Additionally in some places avalanches can also penetrate deep layers. Increase in danger of wet avalanches in particular in the regions exposed to precipitation.

### Snowpack

**Danger patterns**

dp.10: springtime scenario

The Avalanche Warning Service currently has only a small amount of information that has been collected in the high Alpine regions, so that the avalanche danger should be investigated especially thoroughly in the relevant locality. The sleet will give rise in the afternoon to moistening of the snowpack.

### Tendency

Up to 2000 m and above rain will fall on Monday over a wide area. In addition the danger of dry and wet avalanches will increase.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Monday 01 05 2023

In all aspects a little snow is lying.

Increase in danger of wet snow slides as a consequence of the rain.

### Snowpack

**Danger patterns**

dp.10: springtime scenario

At low and intermediate altitudes from a snow sport perspective, in most cases insufficient snow is lying.

### Tendency

Up to 2000 m and above rain will fall on Monday in some regions.
