

## Danger Level 3 - Considerable

**Tendency: Constant avalanche danger** →  
on Thursday 07 03 2024

Persistent weak layer

Snowpack stability: **poor**  
Frequency: **some**  
Avalanche size: **large**

Wind slab

Snowpack stability: **poor**  
Frequency: **some**  
Avalanche size: **medium**

Gliding snow

Snowpack stability: **very poor**  
Frequency: **few**  
Avalanche size: **large**

Increase in avalanche danger as a consequence of new snow and wind. Weakly bonded old snow is to be evaluated with care and prudence. Fresh wind slabs at high altitude.

As a consequence of new snow and wind there will be an increase in the avalanche danger. Avalanches can be released in near-surface layers of the snowpack and reach quite a large size. In the regions exposed to heavier precipitation individual natural avalanches are possible. Avalanche prone locations are to be found in all aspects above approximately 2400 m. Shady slopes where surface hoar has been covered with snow are especially unfavourable. Defensive route selection is recommended.

In addition the fresh wind slabs should be taken into account. They can be released by a single winter sport participant above the tree line. This applies especially adjacent to ridgelines and in pass areas. Mostly avalanches are medium-sized.

On rocky slopes dry loose snow avalanches are possible as the day progresses. In the event of prolonged bright spells this applies.

In addition a latent danger of gliding avalanches exists, in particular on steep sunny slopes below approximately 2600 m, as well as on steep shady slopes below approximately 2400 m. These can reach dangerously large size. Areas with glide cracks are to be avoided as far as possible.

## Snowpack

### Danger patterns

dp.8: surface hoar blanketed with snow

dp.4: cold following warm / warm following cold

Over a wide area 30 to 60 cm of snow will fall. In some places new snow is lying on surface hoar. Faceted

weak layers exist in the top section of the old snowpack in particular on west, north and east facing slopes. This applies above approximately 2400 m.

The fresh wind slabs are lying on soft layers.

## Tendency

Backcountry touring and other off-piste activities call for extensive experience in the assessment of avalanche danger and restraint. Weakly bonded old snow represents the main danger.

## Danger Level 3 - Considerable

**Tendency: Constant avalanche danger** →

on Thursday 07 03 2024

Wind slab

Treeline

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **large**

New snow

1500m

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

### The new snow and wind slabs represent the main danger.

The fresh and older wind slabs can be released easily by a single winter sport participant above the tree line. Mostly avalanches are medium-sized. The number and size of avalanche prone locations will increase with altitude. Isolated natural avalanches are possible as a consequence of new snow and strong wind.

Avalanches can in very isolated cases be triggered in the old snowpack. Avalanche prone locations are to be found in particular on very steep east, north and west facing slopes above approximately 2400 m.

An appreciable danger of gliding avalanches exists, in particular on steep sunny slopes below approximately 2600 m, as well as on steep shady slopes below approximately 2400 m. These can reach dangerously large size. Areas with glide cracks are to be avoided as far as possible.

### Snowpack

#### Danger patterns

dp.6: cold, loose snow and wind

dp.2: gliding snow

Over a wide area 20 to 40 cm of snow, and even more in some localities, will fall above approximately 1200 m.

Fresh and somewhat older wind slabs are lying on soft layers in particular on shady slopes. This applies above approximately 2600 m. In some places new snow is lying on surface hoar.

### Tendency

Backcountry touring and other off-piste activities call for extensive experience in the assessment of avalanche danger and restraint. The weather conditions will facilitate a gradual settling of the snowpack.

## Danger Level 2 - Moderate

**Tendency: Increasing avalanche danger**

on Thursday 07 03 2024

**Persistent weak layer**

2400m

Snowpack stability: **poor**Frequency: **some**Avalanche size: **medium****Wind slab**

Treeline

Snowpack stability: **poor**Frequency: **some**Avalanche size: **medium****Gliding snow**

2600m

Snowpack stability: **very poor**Frequency: **few**Avalanche size: **large**

Increase in avalanche danger as a consequence of new snow and wind. Weakly bonded old snow is to be evaluated with care and prudence. Fresh wind slabs at high altitude.

As a consequence of new snow and wind there will be an increase in the avalanche danger within the current danger level. Avalanches can be released in near-surface layers of the snowpack and reach medium size. Avalanche prone locations are to be found in particular on very steep west, north and east facing slopes above approximately 2400 m. Shady slopes where surface hoar has been covered with snow are especially unfavourable. Meticulous route selection is recommended.

In addition the fresh wind slabs should be taken into account. They can be released by a single winter sport participant above the tree line. This applies especially adjacent to ridgelines and in pass areas. Mostly avalanches are medium-sized.

On rocky slopes dry loose snow avalanches are possible as the day progresses. In the event of prolonged bright spells this applies.

In addition a latent danger of gliding avalanches exists, in particular on steep sunny slopes below approximately 2600 m, as well as on steep shady slopes below approximately 2400 m. These can reach dangerously large size. Areas with glide cracks are to be avoided as far as possible.

### Snowpack

**Danger patterns**

dp.8: surface hoar blanketed with snow

dp.6: cold, loose snow and wind

Over a wide area 10 to 30 cm of snow, and even more in some localities, will fall. In some places new snow

is lying on surface hoar. This applies above approximately 2400 m.

The fresh wind slabs are lying on soft layers.

## Tendency

Temporary increase in avalanche danger as a consequence of warming during the day and solar radiation. Backcountry touring and other off-piste activities call for extensive experience in the assessment of avalanche danger.

## Danger Level 3 - Considerable

**Tendency: Constant avalanche danger** →  
on Thursday 07 03 2024

Treeline

**Tendency: Constant avalanche danger** →

on Thursday 07 03 2024

Wind slab

Treeline

Snowpack stability: **poor**Frequency: **few**Avalanche size: **medium**

Wind slabs require caution. In addition individual gliding avalanches and moist snow slides are to be expected.

Wind slabs can be released by a single winter sport participant in isolated cases in particular on steep shady slopes at high altitude. Mostly avalanches are only small.

On steep grassy slopes mostly small gliding avalanches and moist snow slides are possible.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

dp.10: springtime scenario

Some snow will fall in particular in the north. The wind slabs are in isolated cases prone to triggering.

The snowpack will be moist below approximately 2400 m. At low altitude hardly any snow is lying.

## Tendency

Moist loose snow slides require caution.
