The avalanche danger is within the lower range of danger level 4 (high). Weakly bonded old snow is to be evaluated with care and prudence. Fresh wind slabs at high altitude.

Natural avalanches are a clear indication of a weakly bonded snowpack. More natural avalanches are possible. Avalanches can be triggered in near-surface layers and reach quite a large size. Avalanche prone locations are to be found in all aspects above the tree line. Shady slopes where surface hoar has been covered with snow are especially unfavourable. Great caution and restraint are required.

In addition the fresh wind slabs should be taken into account. They can be released by a single winter sport participant above the tree line. This applies especially adjacent to ridgelines and in pass areas. Mostly avalanches are medium-sized.

On rocky slopes dry loose snow avalanches are possible as the day progresses. In the event of prolonged bright spells this applies.

In addition a latent danger of gliding avalanches exists, in particular on steep sunny slopes below approximately 2600 m, as well as on steep shady slopes below approximately 2400 m. These can reach dangerously large size. Areas with glide cracks are to be avoided as far as possible.

Snowpack

Danger patterns

(dp.8: surface hoar blanketed with snow)

(dp.4: cold following warm / warm following cold)

Over a wide area 40 to 60 cm of snow, and even more in some localities, has fallen. In some places new snow is lying on surface hoar. Faceted weak layers exist in the top section of the old snowpack in particular

on west, north and east facing slopes. This applies above approximately 2400 m.

The fresh wind slabs are lying on soft layers.

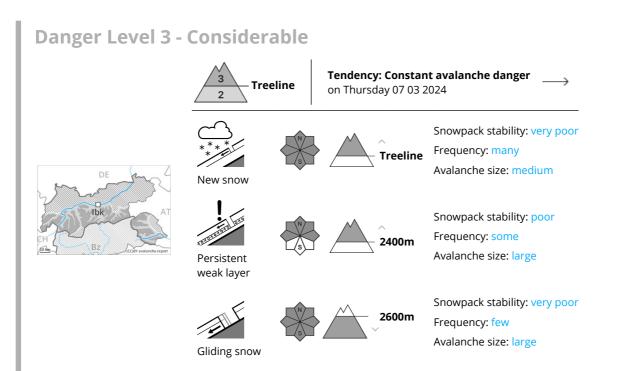

Tendency

Backcountry touring and other off-piste activities call for extensive experience in the assessment of avalanche danger and restraint. Weakly bonded old snow represents the main danger.

Updated 06 03 2024, 11:54

The avalanche danger in particular in the regions exposed to heavier precipitation is within the upper range of danger level 3 (considerable). More snow than expected has fallen in some regions. Weakly bonded old snow is to be evaluated with care and prudence.

In the regions exposed to heavier precipitation more frequent natural avalanches are possible. In the event of prolonged bright spells this applies. Avalanches can be released in near-surface layers of the snowpack. Avalanche prone locations are to be found in all aspects above the tree line. Shady slopes where surface hoar has been covered with snow are especially unfavourable. Defensive route selection is recommended.

In addition the fresh wind slabs should be taken into account. They can be released by a single winter sport participant above the tree line. This applies especially adjacent to ridgelines and in pass areas. Mostly avalanches are medium-sized.

On rocky slopes dry loose snow avalanches are possible as the day progresses. In the event of prolonged bright spells this applies.

Avalanche.report

New snow and wind slabs require caution.

Avalanches can be released in near-surface layers of the snowpack and reach medium size. Avalanche prone locations are to be found above the tree line. Shady slopes where surface hoar has been covered with snow are especially unfavourable. Meticulous route selection is recommended.

In addition the fresh wind slabs should be taken into account. They can be released by a single winter sport participant above the tree line. This applies especially adjacent to ridgelines and in pass areas. Mostly avalanches are medium-sized.

On rocky slopes dry loose snow avalanches are possible as the day progresses. In the event of prolonged bright spells this applies.

In addition a latent danger of gliding avalanches exists, in particular on steep sunny slopes below approximately 2600 m, as well as on steep shady slopes below approximately 2400 m. These can reach dangerously large size. Areas with glide cracks are to be avoided as far as possible.

Snowpack

Danger patterns

(dp.8: surface hoar blanketed with snow)

) (dp.6: cold, loose snow and wind)

Over a wide area 10 to 30 cm of snow, and even more in some localities, has fallen. Over a wide area new snow is lying on soft layers. In some places new snow is lying on surface hoar.

Tendency

Temporary increase in avalanche danger as a consequence of warming during the day and solar radiation.
