

Danger Level 2 - Moderate

Tendency: Increasing avalanche danger
 on Wednesday 27 03 2024

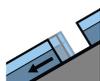

Wind slab

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **small**

Gliding snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Wind slabs require caution. Gliding avalanches require caution.

As a consequence of new snow and a strong wind from southerly directions, avalanche prone wind slabs will form in some places. Caution is to be exercised in particular on very steep shady slopes above approximately 2400 m, as well as adjacent to ridgelines in high Alpine regions. Avalanches are only small but can be released even by a single winter sport participant.

A latent danger of gliding avalanches exists. This applies on steep grassy slopes below approximately 2600 m. Avalanches can reach medium size. Areas with glide cracks are to be avoided.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

dp.2: gliding snow

In some localities up to 10 cm of snow will fall above approximately 1400 m. The wind will be strong to storm force at times.

Fresh wind slabs will be deposited on soft layers in particular on shady slopes at elevated altitudes. The old snowpack will be moist below approximately 2400 m.

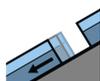

Tendency

Over a wide area over a wide area 20 to 40 cm of snow, and even more in some localities, will fall on Wednesday. As a consequence of new snow and a strong to storm force wind from southerly directions, sometimes large wind slabs will form. Gliding snow requires caution.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Wednesday 27 03 2024

Gliding snow

2600m

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Wind slab

2400m

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

Gliding snow requires caution. Wind slabs at elevated altitudes.

A latent danger of gliding avalanches exists. This applies on steep grassy slopes below approximately 2600 m. Avalanches can reach medium size. Areas with glide cracks are to be avoided.

As a consequence of a strong wind from westerly directions, mostly small wind slabs formed in isolated cases. Such avalanche prone locations are to be found in particular on very steep shady slopes above approximately 2400 m. These places are rather rare and are clearly recognisable to the trained eye. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

In addition individual small loose snow avalanches are possible.

Snowpack

Danger patterns

dp.2: gliding snow

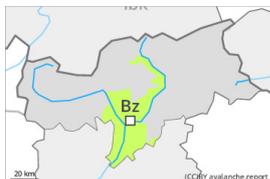

dp.6: cold, loose snow and wind

Some snow has fallen since Saturday in some regions. The wind was strong in some cases. Fresh wind slabs are lying on soft layers in particular on shady slopes at elevated altitudes. The old snowpack will be moist below approximately 2400 m.

Tendency

Gliding snow requires caution. Over a wide area over a wide area 20 to 40 cm of snow, and even more in some localities, will fall on Wednesday. As a consequence of new snow and a strong to storm force wind from southerly directions, sometimes large wind slabs will form.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Wednesday 27 03 2024

Low avalanche danger will prevail.

Individual avalanche prone locations for dry avalanches are to be found on extremely steep shady slopes at elevated altitudes. Avalanches are small and can mostly only be released by large loads.

In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

Only a little snow is now lying. The snowpack will be generally stable. The snowpack is moist and its surface has a crust. The solar radiation will give rise to moistening of the snowpack especially on steep sunny slopes.

Tendency

In some localities up to 15 cm of snow, and even more in some localities, will fall on Wednesday. As a consequence of new snow and a strong wind from southerly directions, sometimes avalanche prone wind slabs will form.
