

Danger Level 2 - Moderate

Tendency: Increasing avalanche danger 
 on Saturday 06 04 2024

Wet snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Gliding snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **large**

Wet and gliding avalanches are the main danger. Wet and gliding snow require caution.

On steep grassy slopes medium-sized to large gliding avalanches are possible. This applies especially on steep sunny slopes below approximately 2800 m, including on steep shady slopes below approximately 2600 m. Caution is to be exercised in areas with glide cracks.

As a consequence of warming during the day and the solar radiation, the likelihood of moist and wet avalanches being released will increase gradually, especially on steep sunny slopes below approximately 2800 m, as well as on steep shady slopes below approximately 2600 m.

The fresh wind slabs are in some cases prone to triggering in particular on northwest to north to east facing aspects above approximately 2400 m. Avalanches can especially at their margins be released, even by a single winter sport participant. Avalanches can release the wet old snow as well and reach large size in isolated cases. The number and size of avalanche prone locations will increase with altitude.

Snowpack

Danger patterns

dp.10: springtime scenario

dp.2: gliding snow

Outgoing longwave radiation during the night will be reduced. The surface of the snowpack will only just freeze and will already soften in the late morning. This applies in particular on sunny slopes at intermediate and high altitudes, as well as on shady slopes below approximately 2600 m.

The more recent wind slabs are lying on soft layers on very steep shady slopes at high altitudes and in high Alpine regions.

Tendency

The weather will be exceptionally warm. Further increase in danger of wet and gliding avalanches as a consequence of warming.

Danger Level 2 - Moderate

Tendency: Increasing avalanche danger
on Saturday 06 04 2024

Gliding snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Wet snow

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **small**

Gliding avalanches and moist snow slides are the main danger.

On steep grassy slopes small and medium-sized gliding avalanches are possible. Caution is to be exercised in areas with glide cracks.

As a consequence of warming during the day and the solar radiation, the likelihood of moist and wet avalanches being released will increase gradually, especially on sunny slopes, as well as on steep shady slopes also at intermediate and high altitudes.

Snowpack

Danger patterns

dp.2: gliding snow

dp.10: springtime scenario

Outgoing longwave radiation during the night will be reduced. The surface of the snowpack will only just freeze and will already soften in the late morning. This applies in particular on sunny slopes at intermediate and high altitudes, as well as on shady slopes below approximately 2400 m.

The more recent wind slabs are lying on soft layers on very steep shady slopes at elevated altitudes.

Tendency

The weather will be exceptionally warm. Further increase in danger of wet and gliding avalanches as a consequence of warming.
