## Danger Level 3 - Considerable

**AM:**

**Tendency: Decreasing avalanche danger**

on Tuesday 09 04 2024

Wet snow

2200m

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Gliding snow

2600m

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

**PM:**

**Tendency: Decreasing avalanche danger**

on Tuesday 09 04 2024

Wet snow

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **large**

Gliding snow

2600m

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **large**

The weather will be exceptionally warm. The danger of wet avalanches will increase quickly during the day.

As a consequence of warming and solar radiation, the natural activity of wet avalanches will rapidly increase. This applies on steep east and west facing slopes below approximately 2800 m, as well as on steep south facing slopes in all altitude zones, this also applies on shady slopes below approximately 2600 m. In some cases the wet avalanches can release the saturated snowpack and reach large size. In steep gullies avalanches can in some cases reach areas without any snow cover.

On steep grassy slopes more frequent medium-sized and, in isolated cases, large gliding avalanches are possible below approximately 2600 m. Areas with glide cracks are to be avoided.

Backcountry tours and ascents to alpine cabins should be started early and concluded timely.

## Snowpack

**Danger patterns**

dp.10: springtime scenario

dp.2: gliding snow

Over a wide area a clear night. The wind will be moderate to strong in particular on the Main Alpine Ridge and to the north. The weather will be exceptionally warm. The surface of the snowpack has frozen to form

a strong crust only at high altitudes and will soften quickly. Sunshine and high temperatures will give rise from late morning to extreme and thorough wetting of the snowpack especially on very steep slopes. These conditions will cause a rapid weakening of the snowpack. In areas with a thinner snowpack the saturation and consequently the loss of strength happens more rapidly. Hardly any snow is lying at low and intermediate altitudes.

## Tendency

Some snow will fall. The danger of wet avalanches will decrease.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Tuesday 09 04 2024

Wet snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

The weather will be exceptionally warm. The danger of wet avalanches will increase quickly during the day.

As a consequence of warming and solar radiation, the natural activity of wet avalanches will rapidly increase. This applies in all aspects. In some cases the wet avalanches can release the saturated snowpack and reach medium size in isolated cases. On steep grassy slopes small and, in isolated cases, medium-sized gliding avalanches are possible.

### Snowpack

#### Danger patterns

dp.10: springtime scenario

Over a wide area a clear night. The weather will be exceptionally warm. The surface of the snowpack has frozen to form a strong crust only at high altitudes and will soften quickly. These conditions will cause a rapid weakening of the snowpack. Hardly any snow is lying at low and intermediate altitudes.

### Tendency

The weather will be exceptionally warm. The danger of wet and gliding avalanches will persist.
