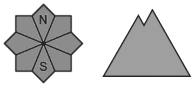
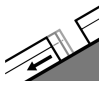
Danger Level 3 - Considerable

Tendency: Decreasing avalanche danger
on Tuesday 09 04 2024

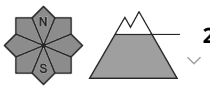
Wet snow



Snowpack stability: very poor
Frequency: many
Avalanche size: medium



Gliding snow



Snowpack stability: poor
Frequency: some
Avalanche size: large

Wet and gliding avalanches are the main danger. Wet and gliding snow require caution.

As a consequence of warming during the day and the solar radiation, the likelihood of gliding avalanches and wet snow slides being released will increase quickly in all aspects. In isolated cases, wet avalanches can reach intermediate altitudes in steep gullies.
On steep grassy slopes medium-sized and large gliding avalanches are possible. This applies on steep sunny slopes in all altitude zones, as well as on steep shady slopes below approximately 2600 m. Areas with glide cracks are to be avoided.

Snowpack

Danger patterns dp.10: springtime scenario | dp.2: gliding snow

Outgoing longwave radiation during the night was reduced. The surface of the snowpack is not frozen and will already be soft in the early morning. Sunshine and high temperatures will give rise as the day progresses to extreme and thorough wetting of the snowpack. This applies on sunny slopes in all altitude zones, as well as on shady slopes also at intermediate and high altitudes.

Tendency

The danger of wet and gliding avalanches will decrease gradually, but only during the night.

Danger Level 3 - Considerable

Tendency: Decreasing avalanche danger
on Tuesday 09 04 2024

Wet snow

Snowpack stability: very poor
Frequency: some
Avalanche size: large

Gliding snow

2600m

Snowpack stability: very poor
Frequency: few
Avalanche size: large

The weather will be exceptionally warm. The danger of wet avalanches will already increase in the early morning.

As a consequence of warming and solar radiation, the natural activity of wet avalanches will rapidly increase. This applies on steep east and west facing slopes below approximately 2800 m, as well as on steep south facing slopes in all altitude zones, this also applies on shady slopes below approximately 2600 m. In some cases the wet avalanches can release the saturated snowpack and reach large size.

On steep grassy slopes more frequent medium-sized and, in isolated cases, large gliding avalanches are possible below approximately 2600 m. Areas with glide cracks are to be avoided. In steep gullies wet avalanches can in some cases reach areas without any snow cover.

Backcountry tours and ascents to alpine cabins should be started early and concluded timely.

Snowpack

Danger patterns dp.10: springtime scenario | dp.2: gliding snow

A partly overcast night. The wind will be moderate to strong in particular on the Main Alpine Ridge and to the north. The weather will be exceptionally warm. The surface of the snowpack will only just freeze and

will soften earlier than the day before. Sunshine and high temperatures will give rise from late morning to extreme and thorough wetting of the snowpack especially on very steep slopes. These conditions will cause a rapid weakening of the snowpack. In areas with a thinner snowpack the saturation and consequently the loss of strength happens more rapidly.
Hardly any snow is lying at low and intermediate altitudes.

Tendency

Some snow will fall. The danger of wet avalanches will decrease.

Danger Level 3 - Considerable

AM:

Tendency: Decreasing avalanche danger

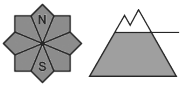
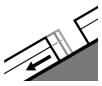
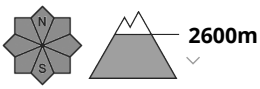
Wet snow



Snowpack stability: very poor
Frequency: some
Avalanche size: small



Gliding snow

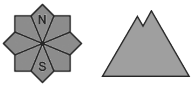


Snowpack stability: very poor
Frequency: some
Avalanche size: medium

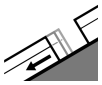
PM:

Tendency: Decreasing avalanche danger
on Tuesday 09 04 2024

Wet snow



Snowpack stability: very poor
Frequency: some
Avalanche size: medium



Gliding snow

Snowpack stability: very poor
Frequency: some
Avalanche size: large

The danger of wet avalanches will already increase in the early morning.

As a consequence of warming and solar radiation, the natural activity of wet avalanches will rapidly increase. This applies on steep east, south and west facing slopes, this also applies on shady slopes below approximately 2400 m. The wet avalanches can release the saturated snowpack and reach medium size.

On steep grassy slopes more frequent medium-sized and, in isolated cases, large gliding avalanches are possible below approximately 2600 m. Areas with glide cracks are to be avoided. In steep gullies wet avalanches can in isolated cases reach areas without any snow cover.

Backcountry tours and ascents to alpine cabins should be started and concluded very early.

Snowpack

Danger patterns dp.10: springtime scenario | dp.2: gliding snow

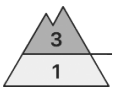
The weather will be exceptionally warm. The wind will be moderate to strong adjacent to ridgelines especially in the regions exposed to the foehn wind. The surface of the snowpack will freeze very little and will soften earlier than the day before. Sunshine and high temperatures will give rise from late morning to extreme and thorough wetting of the snowpack especially on very steep slopes. These conditions will cause

a rapid weakening of the snowpack. In areas with a thinner snowpack the saturation and consequently the loss of strength happens more rapidly.
Hardly any snow is lying at low and intermediate altitudes.

Tendency

Some snow will fall. As the temperature drops there will be a gradual decrease in the danger of wet avalanches.

Danger Level 3 - Considerable



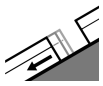
Treeline

Tendency: Decreasing avalanche danger
on Tuesday 09 04 2024

Wet snow

Treeline

Snowpack stability: very poor
Frequency: some
Avalanche size: medium



Gliding snow

2000m

Snowpack stability: very poor
Frequency: few
Avalanche size: medium

Gliding avalanches and moist snow slides are the main danger.

On steep grassy slopes medium-sized gliding avalanches are possible. As a consequence of warming during the day and the solar radiation, the likelihood of gliding avalanches and wet snow slides being released will increase quickly in all aspects, not only on sunny slopes, including on steep shady slopes at intermediate and high altitudes. In isolated cases, wet avalanches can reach intermediate altitudes in steep gullies. Areas with glide cracks are to be avoided.

Snowpack

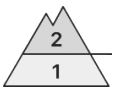
Danger patterns dp.10: springtime scenario | dp.2: gliding snow

Outgoing longwave radiation during the night will be reduced in some case. The surface of the snowpack will freeze very little and will already be soft in the early morning. This applies on sunny slopes in all altitude zones, as well as on shady slopes also at intermediate and high altitudes.

Tendency

The danger of wet and gliding avalanches will decrease gradually, but only during the night.

Danger Level 2 - Moderate



2000m

Tendency: Constant avalanche danger
on Tuesday 09 04 2024

Wet snow

2000m

Snowpack stability: very poor
Frequency: few
Avalanche size: medium

The weather will be exceptionally warm. The danger of wet avalanches will increase quickly during the day.

As a consequence of warming and solar radiation, the natural activity of wet avalanches will rapidly increase. This applies in all aspects. In some cases the wet avalanches can release the saturated snowpack and reach medium size in isolated cases. On steep grassy slopes small and, in isolated cases, medium-sized gliding avalanches are possible.

Snowpack

Danger patterns dp.10: springtime scenario

Over a wide area a clear night. The weather will be exceptionally warm. The surface of the snowpack has frozen to form a strong crust only at high altitudes and will soften quickly. These conditions will cause a rapid weakening of the snowpack. Hardly any snow is lying at low and intermediate altitudes.

Tendency

The weather will be exceptionally warm. The danger of wet and gliding avalanches will persist.
