Danger Level 3 - Considerable

Tendency: Constant avalanche danger →
on Wednesday 10 04 2024

Wet snow

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

Gliding snow

2600m

Frequency: **few**

Avalanche size: **medium**

The weather will be exceptionally warm. The danger of wet avalanches will already be elevated in the early morning. Little snow will fall in the evening.

In the early morning the natural activity of wet avalanches will rapidly increase. This applies on steep east and west facing slopes below approximately 2800 m, as well as on steep south facing slopes in all altitude zones, this also applies on shady slopes below approximately 2600 m. In some cases the wet avalanches can release the saturated snowpack and reach large size.

On steep grassy slopes individual medium-sized gliding avalanches are possible below approximately 2600 m. Areas with glide cracks are to be avoided. In steep gullies wet avalanches can in some cases reach areas without any snow cover.

Backcountry tours and ascents to alpine cabins should be started very early and concluded timely.

Snowpack

Danger patterns

dp.10: springtime scenario

dp.6: cold, loose snow and wind

The surface of the snowpack will cool hardly at all during the overcast night and will already be soft in the early morning. Until the evening the weather will be exceptionally warm. The high temperatures will give rise to extreme and thorough wetting of the snowpack especially on very steep slopes. These conditions will cause a rapid weakening of the snowpack.

In particular in the north in some localities up to 10 cm of snow will fall in the evening. The wind will be strong to storm force in particular on the Main Alpine Ridge and to the north. The fresh wind slabs are mostly very small.

Tendency

Temporary increase in danger of dry avalanches as a consequence of the new snow. Temporary decrease in danger of wet avalanches as the temperature drops.

Snowpack

Danger patterns

dp.10: springtime scenario

dp.6: cold, loose snow and wind

The surface of the snowpack will cool hardly at all during the overcast night and will already be soft in the early morning. Until the evening the weather will be exceptionally warm. The high temperatures will give rise to extreme and thorough wetting of the snowpack especially on very steep slopes. These conditions will cause a rapid weakening of the snowpack.

In some regions 10 to 25 cm of snow will fall in the evening. The wind will be strong to storm force in particular on the Main Alpine Ridge and to the north. As a consequence of new snow and a strong wind, mostly small wind slabs will form towards the evening. The fresh wind slabs are in some cases prone to triggering.

Tendency

Temporary increase in danger of dry avalanches as a consequence of the new snow. Temporary decrease in danger of wet avalanches as the temperature drops.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Wednesday 10 04 2024

Wet snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **small**

The weather will be exceptionally warm. Wet snow requires caution.

As a consequence of warming, the activity of wet avalanches will rapidly increase. This applies in all aspects. In some cases the wet avalanches can release the saturated snowpack. Mostly they are rather small.

On steep grassy slopes mostly small gliding avalanches are possible.

Snowpack

Danger patterns

dp.10: springtime scenario

Until the evening the weather will be exceptionally warm. The surface of the snowpack will cool hardly at all during the overcast night and will already be soft in the early morning. These conditions will cause a rapid weakening of the snowpack. Hardly any snow is lying at low and intermediate altitudes.

Tendency

Temporary decrease in danger of wet avalanches as the temperature drops. Some snow will fall in some regions.
