

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →

on Wednesday 17 04 2024

Gliding snow

2600m

Frequency: **few**

Avalanche size: **large**

Wet snow

2600m

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Decrease in danger of wet avalanches as the temperature drops. Wet and gliding snow require caution.

More medium-sized and, in isolated cases, large gliding avalanches are possible. This applies in particular on steep grassy slopes below approximately 2600 m. Areas with glide cracks are to be avoided.

In the early morning more medium-sized wet avalanches are possible. This applies on very steep slopes below approximately 2600 m.

In isolated cases wet avalanches can release the saturated snowpack and reach large size. In steep gullies avalanches can in isolated cases reach valley bottoms at relatively high altitudes.

## Snowpack

**Danger patterns**

dp.2: gliding snow

dp.10: springtime scenario

The snowpack is wet all the way through. This applies on sunny slopes in all altitude zones, as well as on shady slopes below approximately 2600 m. Some snow will fall in some localities. The meteorological conditions will bring about a gradual strengthening of the snowpack.

The surface of the snowpack will only just freeze and will already be soft in the early morning.

In particular below the tree line only a little snow is now lying.

## Tendency

Decrease in danger of wet avalanches as the temperature drops.

## Danger Level 1 - Low

**Tendency: Decreasing avalanche danger**  
on Wednesday 17 04 2024

Until midday the weather will be very mild. The danger of wet avalanches will already exist in the early morning.

On steep grassy slopes mostly small gliding avalanches are possible. From the middle of the day the activity of wet avalanches will gradually decrease.

### Snowpack

#### Danger patterns

dp.10: springtime scenario

dp.2: gliding snow

The surface of the snowpack will freeze very little and will already be soft in the early morning.

Below approximately 1800 m from a snow sport perspective, in most cases insufficient snow is lying.

### Tendency

Wednesday: The avalanche danger will decrease.
