## Danger Level 2 - Moderate

**Tendency: Increasing avalanche danger**  
on Thursday 02 05 2024

Wet snow

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

### Increase in danger of moist and wet avalanches in the course of the day.

As a consequence of the precipitation, the likelihood of moist and wet avalanches being released will increase gradually especially on extremely steep sunny slopes. Mostly these are small. This also applies in isolated cases on shady slopes below approximately 2800 m.

In addition further gliding avalanches are possible, in particular on steep grassy slopes below approximately 2600 m. Areas with glide cracks are to be avoided.

## Snowpack

### Danger patterns

dp.10: springtime scenario

The surface of the snowpack will freeze to form a strong crust only at high altitudes.

The weather conditions as the day progresses will give rise to increasing softening of the snowpack also on shady slopes at elevated altitudes.

## Tendency

Some snow will fall in some regions. This applies above approximately 2000 m. The danger of dry and wet avalanches will increase during the day.

## Danger Level 1 - Low

**Tendency: Increasing avalanche danger**

on Thursday 02 05 2024

Wet snow

1800m

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

### Increase in danger of wet avalanches in the course of the day.

As a consequence of the rain, the likelihood of moist and wet avalanches being released will increase gradually. This applies in all aspects. Mostly the avalanches are small.

### Snowpack

**Danger patterns**

dp.10: springtime scenario

dp.3: rain

The surface of the snowpack is not frozen and will already be soft in the early morning.

Below approximately 1800 m no snow is lying.

### Tendency

Above approximately 2000 m snow will fall. The danger of moist and wet snow slides will increase but remain within the current danger level.
